IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

Allowable Subject Matter

The following is an examiner's statement of reasons for allowance: Claims 1, 2, 5-7, and 9-12 are allowed over the closest references cited below.

The present invention is drawn to an organometallic compound of formula (I); see claims for full details. Salient features of the compound include: R^2 is a (un)substituted C_6 - C_{40} aryl radical, R^5 is a C_1 - C_{20} alkyl radical, a C_2 - C_{20} alkenyl radical, or an arylalkyl radical, and Z is a divalent group CR^8R^9 - $CR^{10}R^{11}$. Another aspect of the invention is drawn to a process for preparing an organometallic transition metal compound from biscyclopentadienyl ligand system comprising a compound of formula (II). A further embodiment of the invention relates to a catalyst system comprising at least one organometallic transition metal compound (I). Another aspect of the invention is a process for preparing polyolefin in the presence of said catalyst system.

Tanaka *et al.* (U.S. 6,686,055) teaches a transition metal compound represented by formula (I) reproduced below. Substituent R^3 is a secondary or tertiary alkyl group of 3 to 20 carbon atoms or an aromatic group, R^4 is hydrogen or an alkyl group of 1-20 carbon atoms, and Y is a divalent hydrocarbon group of 1-20 carbon atoms or a divalent silicon group, *inter alia*.

Representative compounds of formula (I) include the series, $Me_2Si(2,7-Me_2-4-alkyl-indenyl)_2ZrCl_2$ where alkyl = Et, Bu, hexyl, cyclohexyl, phenylethyl ($-CH_2CH_2Ph$), *i*-Pr, and *t*-Bu, corresponding to R^1 , R^3 , and R^4 being alkyl groups in formula (I). None of these compounds exhibits the indenyl substitution pattern recited in the instant claims (R^2 = (un)substituted C_6 - C_{40}

Art Unit: 1796

aryl group). In this series of compound, the bridging group is Me_2Si rather than a divalent group of formula $\text{CR}^8\text{R}^9\text{-CR}^{10}\text{R}^{11}$.

A subset of compounds in Tanaka *et al.* are those of general formula (Ia) represented by

$\text{Me}_2\text{Si}(2\text{-methyl-4-Ar-indenyl})_2\text{ZrCl}_2$. Note that when R^3 is an aromatic group, substituent R^4 is hydrogen. The reference does not disclose compounds containing a substituent at the 7-position of the indenyl ring when R^3 is aryl. In this series of compound, the bridging group is Me_2Si rather than a divalent group of formula $\text{CR}^8\text{R}^9\text{-CR}^{10}\text{R}^{11}$.

Bingel *et al.* (WO 98/40331; U.S. 6,492,539) teaches preparation of bisindenyl ligands for preparation of the metallocenes. The inventors present three classes of metallocene. The first is represented by formula (VI), where bridge R^{11} has $\text{R}^{12}\text{-M-R}^{13}$, where M is Si or C. This class of compound contains a bridging group with only one atom in the bridge.

Two compounds representative of this class are $\text{Me}_2\text{Si}(2,7\text{-Me}_2\text{-4-PhInd})_2\text{ZrCl}_2$ and $\text{Me}_2\text{Si}(2,7\text{-Me}_2\text{-4-naphthylInd})_2\text{ZrCl}_2$.

Art Unit: 1796

A second class of compound are those in which R^1 is a C_6 - C_{40} linear alkyl, $Y^4 = Y^5 = Y^6 = H$, R^3 is 4- (C_4-C_8) phenyl, and R^{11} is Me_2Si , Ph_2Si , or $Ph(Me)Si$.

The third class of compound are those in which R^1 is a C_1 - C_{10} linear alkyl, Y^4 and Y^5 are hydrogen, C_1 - C_4 alkyl, or C_6 - C_{10} aryl, Y^6 is H, R^3 is a fluorosubstituted aryl, and R^{11} is Me_2Si , or an ethylidene bridge such as CH_2CH_2 , $CH(CH_3)-CH_2$, $CH(CH_3)-CH(CH_3)$, $(CH_3)_2C-CH_2$, or $(CH_3)_2CH-CH(CH_3)_2$.

The two compounds that contain the requisite substituent in the 7-position do not contain an ethylidene bridging group, and those compounds that may contain an ethylidene bridging group lack the non-hydrogen substituent (Y^6 is H). Thus, the compounds taught in Bingel *et al.* do not meet the structural features of the claimed compound. It is the examiner's position that one having ordinary skill in the art would not have found sufficient suggestion or motivation to modify the compounds $Me_2Si(2,7-Me_2-4-PhInd)_2ZrCl_2$ or $Me_2Si(2,7-Me_2-4-naphthylInd)_2ZrCl_2$ with an ethylidene bridging group, and therefore, it would not have been obvious to one of ordinary skill in the art to make the claimed compounds based on the disclosure of Bingel *et al.*

Schulte *et al.* (WO 02/18397; U.S. 6,784,305; U.S. 2003/0199703) teaches a series alkyl-bridged metallocenes having the general structure shown below, left. Substituents R^1 to R^{10} are generically defined. Representative compounds listed in the text are metallocenes containing an ethylene bridge, an aryl group at the 4-position of the indenyl ligand and an alkyl substituent at the 2-position, shown below, right.

Art Unit: 1796

Schulte *et al.* does not disclose a specific compound that exhibits the claimed structural features. One having ordinary skill in the art, having read the patent, would glean that the substantive teaching of the invention is use of a novel, sulfonyloxyalkyl precursor to form an alkylene bridge between two indenyl ligands, and that the method is especially useful for making metallocenes containing 2-alkyl-4-aryl substituted indenyl ligands. While Schulte *et al.* generically recites inclusion of various types of substituent at all ring positions, it is the examiner's position that one having ordinary skill in the art would not have found it obvious to make metallocenes having the minimum 4-/7- substitution pattern exhibited by the claimed compounds, based on the general disclosure of Schulte *et al.*

Küber *et al.* (U.S. 5,840,947) discloses the transition metal complexes 1,2-ethanediylbis(4-(2-pyridyl)-7-methylindenyl)zirconium dichloride and 1,2-ethanediylbis(2-methyl-4-(2-pyridyl)-7-methylindenyl)zirconium dichloride. The substituent at the 4-position of the indenyl ligand is a heteroaromatic group, which is not meet the structural requisite of the instant claim where R² is a (un)substituted C₆-C₄₀ aryl radical.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
